

FITTER HEALTH

RECOMMENDATION LETTER

To who it may concern,

I am pleased to recommend Saa'im Abdullah, who worked with Fitter Health as the backend and data engineer responsible for the foundational architecture of our health-technology platform.

Saa'im was engaged to design and build the backend for our preventive-health platform, and the scope he took on went well beyond typical application development.

He implemented the backend in Django and Django REST Framework with a strong emphasis on production readiness a comprehensive automated test suite, clean migrations, and database-level integrity constraints to guard against data corruption under concurrent use. He containerized the application with Docker and architected the cloud infrastructure on AWS (ECS/Fargate, RDS, S3, SES, SNS, and Celery with Redis for background processing), and designed the notification and file-handling architecture with scalability in mind making sound engineering trade-offs and explaining them clearly to both technical and non-technical stakeholders.

What stood out most was the way he worked: he consistently understood the business problem before writing code, communicated technical decisions in plain language, and delivered work that was well-documented and genuinely transferable to our team.

He frequently delivered ahead of scope and raised architectural considerations we had not thought to ask about. Saa'im combines strong technical depth in backend engineering, cloud infrastructure, and data architecture with the professionalism and communication skills to work effectively in a real team. I recommend him without reservation and I am confident he will excel in a rigorous academic and technical environment.

Sincerely,

Beth Iriarte

Co-founder & CEO
